Department of: Electronic and Telecommunication Engineering

Preface

The final report of the industrial training module EN3993 with the Arimac Lanka (Pvt) Ltd. The students entering the university of Moratuwa to obtain an Honours Degree of Bachelor of Science of Engineering get the opportunity to specialize in the field of Electronic and Telecommunication Engineering. According to the curriculum, twenty four weeks long industrial training is mandatory. This report is prepared to fulfil the requirements of both the University and the National Apprentice and Industrial Training Authority.

The content of the report is in lined with the Intern Electronic Engineer training establishment from 3rd of January 2022 to 3rd of July 2022. This in detail report consists of all the technical and non-technical experiences I gained in the Industry. Starting from the interviewing phase, the processes went through a lot of challenges. The exposure to the industry as a young engineer will be described according to my experience. The support I received from other people was massive. Hope the success story of my Industrial Training module completion with Arimac Lanka robotics team would give other students a motivation. Basically,

- Completion of project work
- Challenges faced during the training
- Experiences gained throughout the internship
- Achievements and Learning outcomes

Will be reported here. I appreciate my commitment and dedication. The document is prepared according to the guidlines provided by the Indutrial training module.

M R A Sirithunga

Department of Electronics and Telecommunication Engineering

University of Moratuwa.

Acknowledgement

The training period went smoothly with the immense support of the faculty members, NAITA and the company team. I would appreciate the support of our training coordinator Dr. Subodha Charles and the evaluator Dr. Peshala Jayasekara. Throughout the industrial training their kind backup was massive. Also, this excellent training period I have had is a result of the beginning of the foundation. Therefore, I would like to pass my gratitude to the directors of the Industrial Training Division of the University of Moratuwa, the National Apprentice and Industrial Training Authority (NAITA), Dr. Ranga Rodrigo: the Head of the Department and all the academic staff of the Electronics and Telecommunication (ENTC) Department, and the batch representatives for selecting these great opportunities for everyone in the batch equally.

The guidance and the help I received from Arimac Lanka team was impressive. Since the beginning of the recruitment process Mr. Sadeesh Kalhara (Research and development Engineer) and Ms. Binuri Dharmasena (Human resource executive) were there at any time for any question. As a newbie to the industry, the availability of my supervisor and the Robotic team were absolutely encouraged me to face challenging tasks. As a result of all the commitments, I could do my best and learn a lot. With more than 200 employees company is rapidly growing even during the Covid pandemic. The privately held company provides IT solution for both local and international clients with greater standards. One of the most attractive employers in the IT industry maintain their unique and pleasant company cultures to attract disruptive talents all over the country. Having said that, It is great to mention Arimac as one of them. The flat hierarchical decentralized environment makes things more convenient than any-

where else. I realized the difference between the academia and the industry during my training period. Having this kind of a training would prepare ourselves to be the best among others.

Finally, I would like to thank my fellow intern Mr. Mayooran Thavendra who is also from my department. Also, the other interns from other universities for making that period memorable and full of exciting learning phases.

Training establishment

Arimac is Sri Lanka's leading digital disruption agency having a product and service portfolio in the categories of Enterprise Web and Mobile, Immersive Technologies, Gaming and Digital Entertainment, Cognitive Sciences and Robotics, and Digitalization and Consumer Ergonomics. Developer of mobile and enterprise applications designed to offer several key product verticals. The company is specialized in technologies such as Augmented Reality (AR), Virtual Reality (VR) and Artificial Intelligence (AI) fusing creativity and talent with improved technology, enabling clients to streamline and simplify day-to-day business operations. Arimac's global presence includes offices in Australia, France, United Arab Emirates, and the Caribbean.

The vision of the cheif executive officer Mr. Chamira Jayasinghe drives the company insane hights. The business was built from zero to where it is today by this truly passionate individual and the employees.

Figure 2.1: Company Logo

Figure 2.2: CEO Mr. Chamira Jayasinghe

With more than 200 employees company is rapidly growing even during the Covid pandemic. The privately held company provides IT solution for both local and international clients with greater standards. One of the most attractive employers in the IT industry maintain their unique and pleasant company cultures to attract disruptive talents all over the country. Having said that, It is great to mention Arimac as one of them. The flat hierarchical decentralized environment makes things more convinient than anywhere else.

Figure 2.4: CompanyStaff

As a company of Sri Lanka, the significant achievements can be identified. Some of them are as follows,

1. First ever 3D game in Sri Lanka.

Figure 2.5: Kanchayudha

2. First ever Humanoid in Sri Lanka.

Figure 2.6: Diyazen

As of now, the gaming and robotics industry is lead by the Arimac Lanka. The journey will continue.

Familiarization work

Initially, the onboarding process with Arimac Lanka was completed. Basically, the required hardcopies were provided to the Human resource team. After, completing that, first day of the internship began. Since it was the beginning of a year, the company management had organized a virtual new year celebration. At the event I got to know more about company culture and some of the coming improvements of the organization. The HR team and the IT support team were having most of the responsibilities with the onboarding. The company was having their own system for tracking all the employees' premises, leaves and attendance to the events. The pre-created account credentials were given to me in order to familiarize with it. The IT support team sent me all the necessary details to set up Microsoft Teams account. Apart from that, a personal email was generated to each employee to communicate within the team. Some of the customizations to the email signature had to be done and it was also a well-documented procedure.

Later that day, the supervisor arranged a meeting with me and the fellow colleague. We introduced ourselves to the team and got to know more insights about work ethics. Next working day a group presentation was assigned to us. The main purpose of the presentation was to improve our familiarity with the humanoid robot developments and ongoing research areas. We presented the findings and did a good presentation in front of our team. The next main task

was to select an available humanoid robot and research about it.

Finally, it was the time to familiar with the technical stack. The availability of a company developed pre-training repository was smoothed our work. The guided tutorial was capable of providing the required basics to us.

After an insightful week I was in a position where I could involve with the team. Then after, all the guidance were provided to me accordingly. The supervisor gave an introduction to the project work needed to be carried out.

Exposure to system

After went through a series of interviews, I got an offer letter. First time I engaged with the company system was the on-boarding process. Basically, I had to deal with the HR team. All the required details and the documents were provided. The training contract was signed accordingly.

Soon after, It was the time to set up my company profile. In this phase an IT support person from the company provided me all the guidance to set up my profile including the E-mail, MS teams, Jira, Gitlab and the Trello environments. Since that time I could meet the top-management people time to time in the progress reporting meetings. After receiving the second monthly allowance, I realized that there was an unexpected pay cut. So, first I contacted the HR team and got to know about the procedure that I needed to follow. Then I wrote an E-mail to the accountant and opened a request.

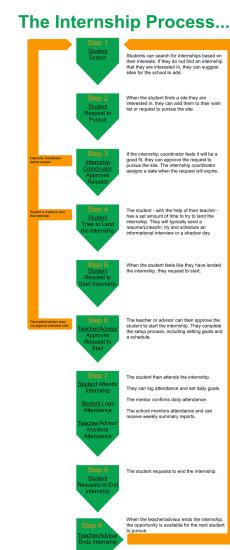

Figure 4.1: Internship Process

Within a few working days the issue was solved. It was a quiet an experience for me as an intern. Anyways I could overcome that struggle smoothly. Finally, the off-boarding peocess was started. Again I went through the given procedure. I had to contact the all the people I dealt with before. Basically, got the approvals from respected departments and requested a service letter.

Project Work

5.1 Background

The field of Robotics is a multidisciplinary and open-ended area that most of the research is going around the world. The introducing of both the computer vision and the AI into robotics has been making a huge impact in the field of Robotics for a few decades. Computer vision libraries like OpenCV and deep learning algorithms like YOLO are at the top of the list. Navigate in an unstructured environment has been challenging for robot developers, because of that vision-based obstacle avoiding and environment mapping approaches are emerging.

5.2 Objective

One of the major concerns among the researchers is the computational cost in image processing. To overcome this, the work that has to be done is huge. In our case, the small obstacles on the floor have been a great challenge for us to smoothly navigate in an indoor environment. Most

of the time, robots get blocked after collided with the small coke cans, toys and clothes on the floor. The solution for this has to be solved with the 3D depth camera sensor. Basically, the perception of the robot should be accurate with the least blind spots in order to achieve the desired outcome.

5.3 Approach

For an autonomous operation, the system with a high accuracy real-time algorithms are optimal. Solutions such as YOLO and pre-built package find object were considered. Most of the time, computational power was the constraint. Therefore, the direction of the solution eventually switched to a custom package from scratch. The output of both RGB and depth images were taken into execute OpenCV operations in order to get the desired outcome. The packages were built to draw contours over the object using binary thresholding and OpenCV methods. Finally, the best possible solution was identified. A depth image subscriber and custom laser data publisher. The outcome was robust and scalable.

Hands-on Experiences

6.1 Find Object 2D

This package is open to use by anyone. The OpenCV based SURF/SIFT algorithms are used in the package. The RGB image will be the input to the package and it will be detected and published on a ROS topic with ID and position (by image pixel coordinates). First, we need to create a sample set of images to detect the features we need to identify. The implementation was successfully detected humans on the image as shown below.

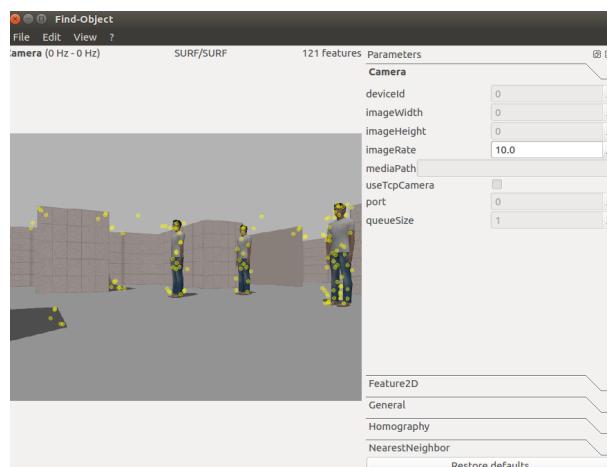

Figure 6.1: Find object 2D

The need is to publish the object coordinates with respect to the camera coordinates. Therefore, the use of Find Object package was not the solution.

6.2 YOLO

Integrating YOLOv3 into ROS is crucial for object detection to be fully utilized in robotics, as it allows for integration with other ROS-based capabilities that lead to exciting new ideas such as integration with Real-Time Appearance-Based Mapping (RTABMap) ROS for Simultaneous Localization and Mapping (SLAM) applications. Deep learning algorithms are highly dependent on the available computational resources. While training may be accomplished on more powerful hardware, issues could appear when implementing these algorithms on low-SWaP platforms. Specifically, if many processes with high memory usage are running simultaneously, darknet Ros may not perform optimally. The integration was successful. Using the pre-trained models, the darknet was able to identify the object and draw a box over it in an appropriate manner. The small obstacles could have been identified with a new model which can be trained using the CUDA. The low frame rate and the significantly lower frame rate caused regret this solution for further development.

6.3 Object Recognition Custom Package

6.3.1 RGB

The navigation in an unstructured environment is quite difficult for a humanoid robot as it may collide with moving objects or small objects on the floor. To overcome this difficult challenge, the use of computer vision would be a great solution. The small objects on the floor should

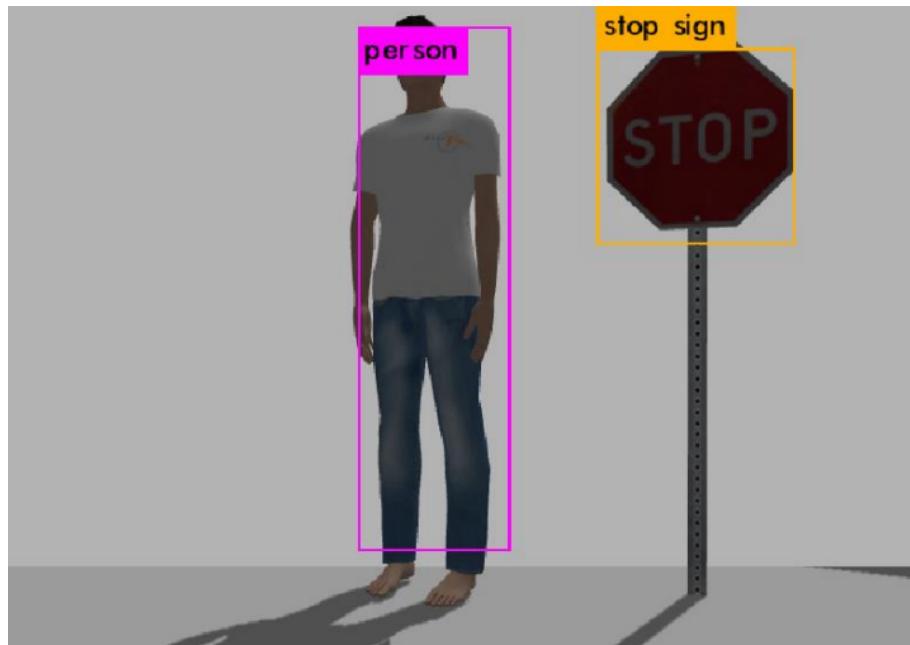

Figure 6.2: YOLO output

differentiate from the floor. To do that, the custom package subscribed to the color image published by the Kinect depth camera. Then the image is converted into OpenCV processible type. The RGB8 image then converted into grayscale format. From that, a proper threshold can be identified in order to create a binary image. The objects are identified and bounding objects can be drawn around them.

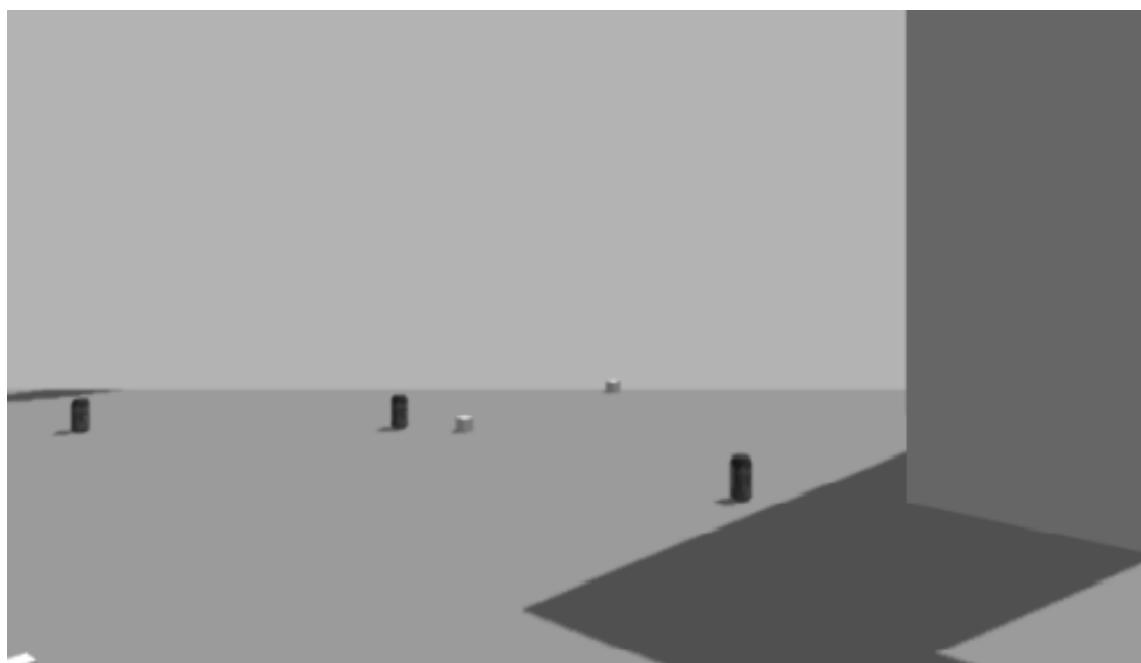

Figure 6.3: Gray Image

Figure 6.4: Binary Image

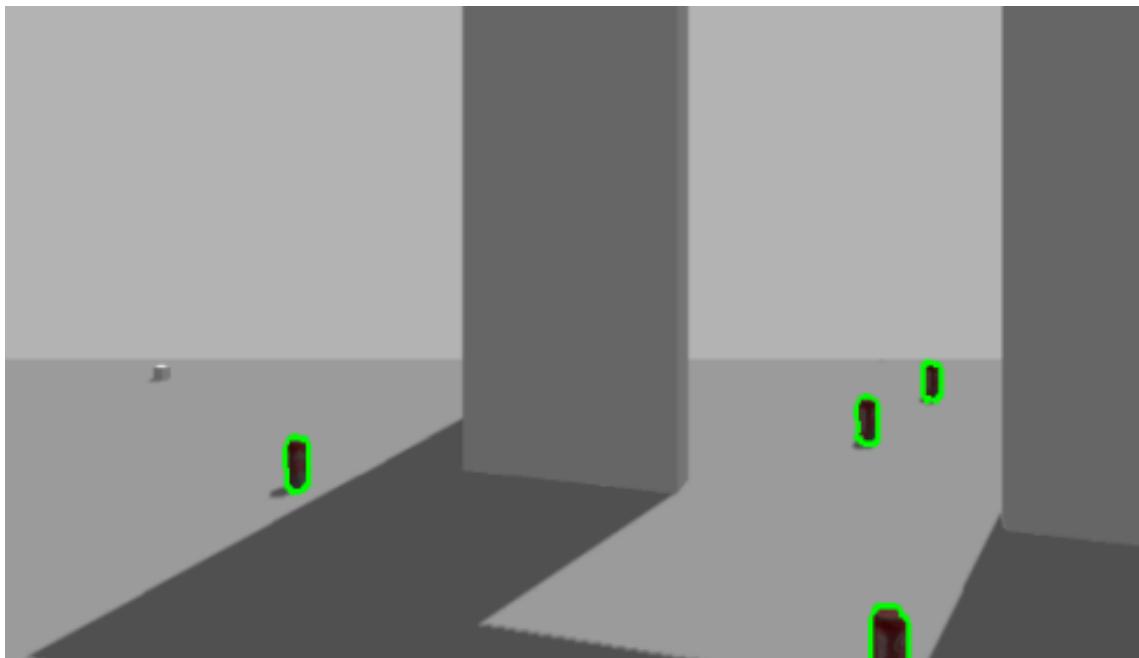

Figure 6.5: Objects Detected

6.3.2 Depth

Depth image manipulation is also possible with the OpenCV library. To do that we have to have a bridge between Ros topic and the OpenCV. As we did for the color image, we could write a subscriber. As the next step, I tried to display the distance to an object using the custom package. If an object is detected, the distance for the object from the camera frame will be displayed in meters. It was successful and the results are as follows.

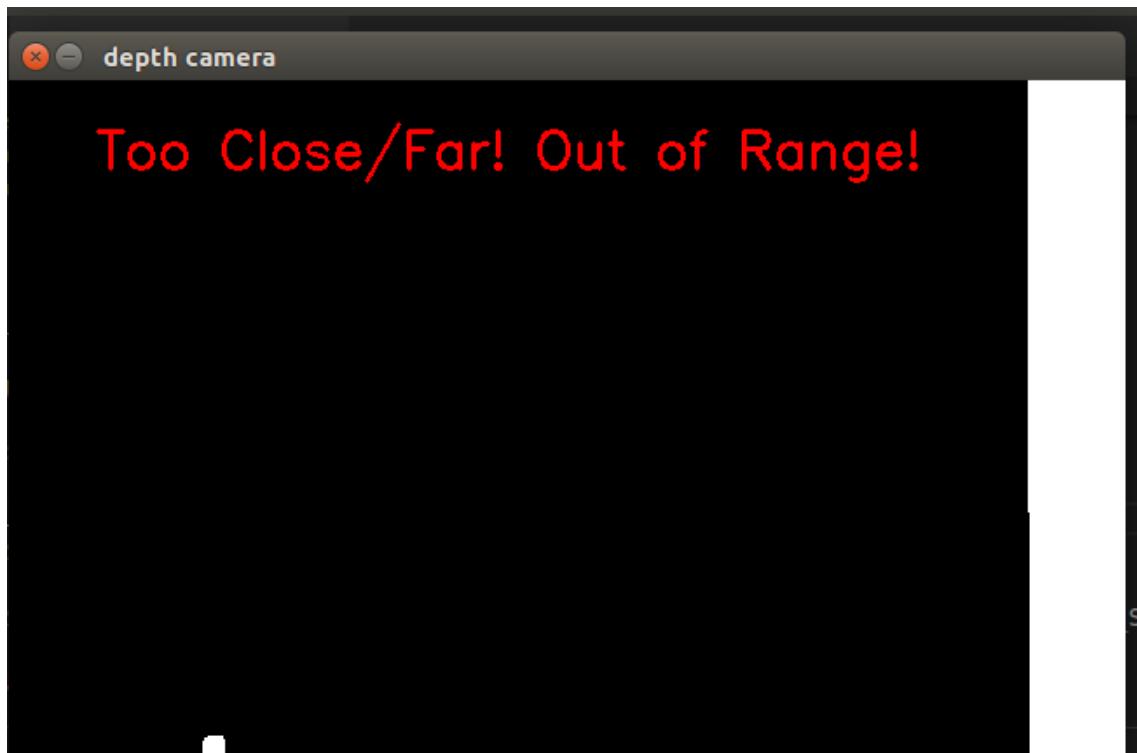

Figure 6.6: Not Detected

As the final step, a custom laser message should be created. Then the created laser message should publish to the ROS needed to be done.

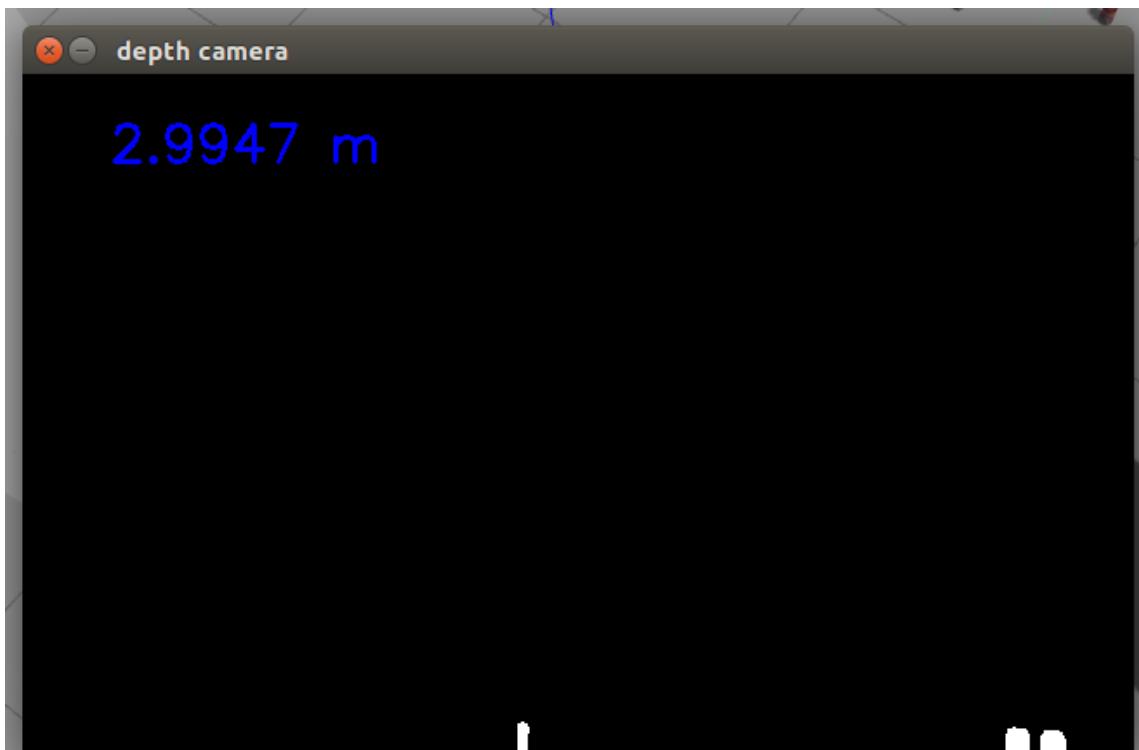

Figure 6.7: Distance Display

6.4 Git and Gitlab

6.4.1 Git

To start with the development task, I went through the Git tutorials that I could learn about the versioning system. The SSH communication was done using private and public key pair. From the "git initiate to merging" was studied and used with the project.

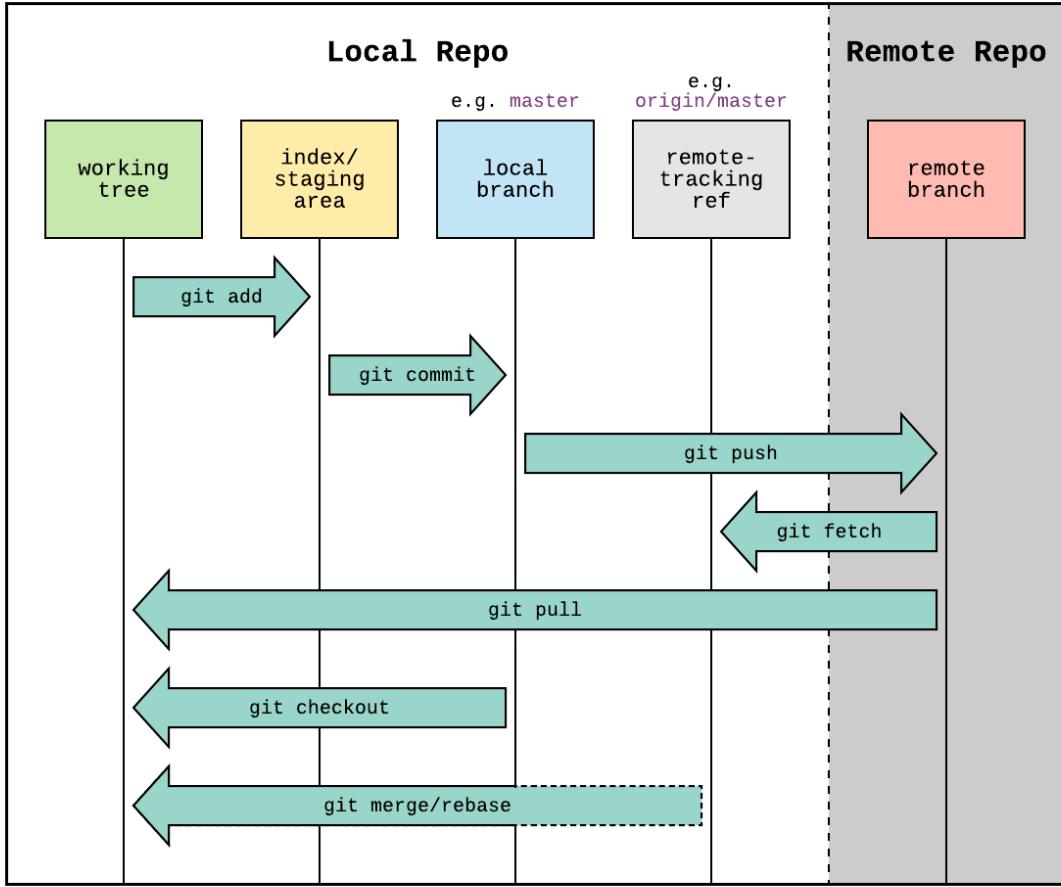

Figure 6.8: Git Explain

6.4.2 Gitlab

All the work were managed on Gitlab private workspace. Basically, the Gitlab private workspace consists of well documented robot simulation up until the Autonomous navigation. The repository was forked into our development projects and testings were done in there. Eventually, I our well organized and documented branches were merged and requested to merge accordingly. This is the most common and appropriate approach in software development.

Apart from that, we use Microsoft visual studio code as our editor. Having a lot of exten-

tions and terminal accessibility, The editor was able to enhance the comfort of the work.

6.5 Jira and Project Management

The project management helps the organization to make the best from their talents and time. The team was following an agile methodology. The outcome based system directly monitor the progress using tools such as Jira. The daily updates to the Jira board should be completed after the daily scrum. It enabled me to stick with the development team and compare my work with others.

The screenshot shows a Jira agile board for the project 'Teams in Space'. The board is divided into four columns: 'To Do', 'In Progress', 'Code Review', and 'Done'. Each column contains several Jira issues, each with a title, description, and status. The 'To Do' column has 12 issues, 'In Progress' has 4, 'Code Review' has 1, and 'Done' has 7. The issues are categorized under sections like 'TIS Developer Love' and 'Everything Else'. A sidebar on the left provides project navigation and a dashboard summary. A detailed view of an issue, TIS-67, is shown on the right, including its description, attachments, and sub-tasks.

Figure 6.9: Jira agile board

Soft skills development

During the internship I got a lot of opportunities to interact with people. Soft skills are non-technical skills that relate to how I work. They include how I interact with colleagues, how you solve problems, and how you manage your work.

7.1 Work Ethic

As an Intern Electronic Engineer, it was my first exposure to the industry. There are actually, a set of dos and don'ts that we should be aware of. Everytime I made a mistake, the team members were always there to support me. At one time, I just changed a code script on my own. Lately, I identified my mistake and corrected it. The help I received from my team to undo my mistake was massive. The industry is moving forward with the collaborative innovations. So, It's good to discuss and learn from others.

7.2 Time management

Time management was a challenge for me since I started working on projects. The prevailing situation cut out a significant portion of day and night time due to lack fuel supplies for the power plants. To overcome this unavoidable and significant consequences effectively was my target. Because of that I did my work even in the late nights and was able to stick with the timeline of the project team.

7.3 Networking

The friendly and flat hierarchy of the company helped me a lot to meet new people and even connect with them in platforms like LinkedIn. It was great and I took all the opportunities to make good connections. Hopefully, having a wider network of professionals with I will be rewarding. More than 70 percent of hiring happen as internal hirings. So, a new space of employment opportunities will open with the networking.

7.4 Creative Thinking

The project team and the supervisor had a growth mindset and always let me to try out different experiments and learn from them. The freedom I needed to unleash my true potential was there. Always be appreciated the work I did on my own.

7.5 Team work

Since the begining of the internship I got paired with the fellow interns and worked together to fulfil tasks. A presentation about Humanoid Robots was at the beginnig. Eventually, more advance and challenging group works were there. Working with a team was much interesting and efficient. I felt that I could easily, find solutions to arising problems with the support of others. We had several meetings on our own and discuss our problems. One thing that I was impressed by is while completing a task I got a problem which cost me around eight working hours, but with the team support, just a simple set of codes solved it quickly.

7.6 Communication Skills

Throughout the internship period of Arimac, I could enhance my communication skills time to time. Starting from the interwieving and on boarding, the opportunity was always there until I got my service letter. The format of a business e-mail was something that I didn't know, but while working with them I caught some insights on the domain and could able to compose a formal e-mail according to the need. Presentation skills were something that I was not very good with. Eventually, by practicing and delivering presentations, I could collect the all basic skills that required to deliver and prepare a presentation. Apart from that, negotiation and general speaking skills were improved.

SWOT Analysis

SWOT analysis is an analytical method/tool which is used to identify and categories significant internal (Strengths and Weaknesses) and external (Opportunities and Threats) factors faced either in a particular arena, such as an organization, or a territory, such as a region, nation, or city. It provides information that is helpful in matching the firms' resources and capabilities to the competitive environment in which it operates and is therefore an important contribution to the strategic planning process. It should not be viewed as a static method with emphasis solely on its output, but should be used as a dynamic part of the management and business development process. Sri Lankan IT industry is the most significant and dynamic contributor to Sri Lanka's economy. It has the potential of becoming one of the leading service providers in the world.

Opportunities	Threats
Have wide range of product and services, can share service of each sector	Have to compete with many other IT companies.
Internationally recognized company, Have larger potential market for the products	Government policies may some time effect in drawn back of the IT services industry and product manufacturing.
Easy to introduce new products to the market	

Table 8.1: External Opportunities and Threats.

Strengths	Weaknesses
Availability of skilled labor	Increasing cost of labor and availability of employment in other industries and foreign employment opportunities.
Educated and trainable work force	Constant power interruptions reduce productivity.
Management of production capacity	Lack of available equipments and maintenance.
Partnered with best international Players	Increasing taxes and import restrictions.
Well established sales and distribution system	
Ability to handle high volume orders	

Table 8.2: Internal Strengths and Weaknesses.

Conclusion

The Industrial Training I completed with the Arimac Lanka Robotics team is one of the most valuable opportunities in my career. As an Electronic and Telecommunication Engineering undergraduate in University of Moratuwa, I could enhance my almost every technical and personal skills with the immense support of so many people. In my opinion the internship could have been more exciting without the prevailing situation of the country. I recommend Arimac Lanka as a great place to complete your internship. They provide you the most valuable skills and experience. The work environment, ethics and rules they follow are best suits for a student growth as a youngster to the Industry.

With more than 200 employees company is rapidly growing even during the Covid pandemic. The privately held company provides IT solution for both local and international clients with greater standards. One of the most attractive employers in the IT industry maintain their unique and pleasant company cultures to attract disruptive talents all over the country. Having said that, It is great to mention Arimac as one of them. The flat hierarchical decentralized environment makes things more convenient than anywhere else.

The outcome based architecture encourage us to deliver more robust and innovative solutions. The appreciation get from the supervisors and the rest of the team mostly motivated me

to achieve my project goals. Everyday scrums were also helped me to keep in track with the project team. Because of that, I pushed myself to the limits and reached to comparatively high standards as an Intern. Opportunity to build good relationships with the industry experts and the top level managers would be appreciated. During the internship I got a lot of opportunities to interact with people. Soft skills are non-technical skills that relate to how I work. They include how I interact with colleagues, how you solve problems, and how you manage your work. Almost every aspect of the work ethics and the policies were maintained accordingly. So the upskilling is smooth and crystal clear.

Thank You!

Arimac Lanka (Pvt) Ltd

27 December 2021

Personal and Confidential

Mr. Asiri Sirithunga,
317/5, Hokandara East,
Hokandara.

Dear Asiri,

Offer to join the Arimac Family!

The Management of Arimac Lanka (Pvt.) Ltd. is pleased to offer you an internship in the capacity of **Intern – Electronic Engineer**, for a period of **06 months** commencing from **03rd January 2022** to **03rd July 2022**.

In addition to the duties that were outlined during your interviews, you shall perform such other duties as are customarily associated with such a position. During your internship you shall adhere to the following terms and conditions:

- To devote 5 days per week of your time to the Company.
- To perform your duties faithfully and to the best of your ability.
- To not engage in any other similar work without the prior approval of your supervisor.

We are confident that your time at Arimac would provide you with plenty of learning opportunities to acquire newer / higher skills and knowledge in preparing for the future. Should you have any queries, an idea to share or a suggestion to offer please do not hesitate to get in touch with us.

Thank you,
Wish you all the best.

Yashodhi Perera
Manager – Human Resources

www.arimaclanka.com
hello@arimaclanka.com
Arimac Digital,
No 02, 6 th Lane,
Colombo 03, Sri Lanka.

14 July 2022

To Whom It May Concern:

Re: Mr. Maddumage Ravindu Asiri Sirithunga

This is to certify that Mr. Maddumage Ravindu Asiri Sirithunga completed his internship period at Arimac Lanka (Pvt) in the capacity of an Intern – Electronic Engineer attached to the Robotics Department from 03rd January 2022 to 03rd July 2022.

Arimac is Sri Lanka's leading digital disruption agency having a product and service portfolio in the categories of Enterprise Web and Mobile, Immersive Technologies, Gaming and Digital Entertainment, Cognitive Sciences and Robotics, and Digitalization and Consumer Ergonomics. Arimac's global presence includes offices in Australia, France, United Arab Emirates, and the Caribbean.

Mr. Sirithunga's role as an Intern – Electronic Engineer is as mentioned below:

Project: Detect small obstacles on the floor using 3D sensor – Gazebo sim.

- Training for the Robot Operating System (ROS) Kinetic Kame on Ubuntu Xenial 16.04, and Git|GitLab with Visual studio code development environment.
- Robotics software development, including C++ image processing with OpenCV library.
- Research and experimental development, including design and test concepts, technical documentation, and also redesign existing solutions.

Mr. Sirithunga possesses a pleasant personality and has good PR skills to work in a team. He was always willing to take on challenges and showed a very positive attitude towards work.

We take this opportunity to wish Mr. Sirithunga all the very best in his future endeavors.

Thank you,

Yours Faithfully,

Yashodhi Perera

Senior Manager – Human Resources

Abstract: Indoor robots are more and more widely used, and their path planning directly affects traverse efficiency and quality, which has always been a hot research topic. Excessive requirements for sensor accuracy and accuracy may reduce the adaptability of path planning or cause unacceptable costs. Based on the analysis of the path planning requirements of the indoor robot, this paper proposes a ROS path planning method based on 2D Lidar-based SLAM. The algorithm is simple and effective. In the simulation test, the robot has a high coverage of the entire area and strong environmental adaptability. Ruchanurucks "*ROS based Autonomous Mobile Robot Navigation using 2D LiDAR and RGB-D Camera*," 2019 First International Symposium on Instrumentation, Control, Artificial Intelligence, and Robotics (ICA-SYMP), 2019, pp. 151-154, doi: 10.1109/ICA-SYMP.2019.8645984. Abstract: This paper presents an implementation of autonomous mobile robot with the robot operating system (ROS). The system utilizes 2D LiDAR and RGB-D camera with ROS 2D navigation stack, with low power consumption and inexpensive onboard computer. Safe to property and human is of priority. Regarding software, we use official ROS packages with minimal default parameter changes. For hardware, the limitation of equipment and system setting are among challenges. Our proposed systems can perform navigation with dynamic obstacle avoidance capability. The Contribution of this paper is two system setups of ROS navigation stack are proposed. The first system is implemented on Raspberry Pi 3 using 2D LiDAR only. The second system is implemented on Intel NUC using 2D LiDAR and RGB-D camera. To evaluate the performance, usability testing was performed in multiple experiments. Our experiment results show that the robot can avoid objects in their path, or stop in case of unavoidable. Discussion of problems and solutions are presented after the experiment results. Available: <https://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=8645984&isnumber=8645979>
